

The background of the entire page is a detailed technical drawing of a mechanical component, likely a filter housing. It features various cross-sections, dimensions, and assembly details. Overlaid on this drawing are several drafting tools: a large orange pencil at the top left, a pair of compasses in the center left, and a fine-point pen in the center. The drawing includes labels such as '15', '55', '17 ± 0.2', '2.5', 'φ 108', 'φ 114', and a surface texture symbol '0.05 A'.

Electric self-cleaning screen filters

FMA 2000 Series Filtration Technology

The separation of solids from a liquid or a gas by means of porous medium or screen which retains the solids and allows the liquid to pass is called filtration. In this case, the liquid will generally be water, and the filtration system will be a stainless steel screen.

On the other hand, the ideal filter is the one that retains the largest number of particles and never clogs up. However, the ideal filter will be the one that can backwash when needed.

The following filter meets all these characteristics.

Automatic Screen Filter

Description

In the filter we can find three perfectly distinct chambers . The first chamber is the prefiltration chamber that coincides with the filter inlet where the screen works as a prefilter.

Inlet	1
Outlet	2
Prefiltration chamber	3
Coarse screen	4
Filtration chamber	5
Fine screen	6
Backwashing chamber	7
Scanner	8
Motor drive	9

Once the water is inside this chamber, it is entering in the 2nd chamber, the filtering chamber, where the real filtering element is: THE FILTRATION SCREEN.

In this chamber the water passes through the screen from inwards to outwards. The coarse particles are retained in the filtering screen. This chamber coincides with the outlet for the filtered water for different solutions: Drinking water, cooling water, etc.

These fine particles retained form the filter cake that generates certain head loss. Once the preset value has been reached, triggers the self-cleaning process. When this value is reached, the DP acts on the control panel that commands the opening of the drain valve, which is housed in the cleaning chamber. The backwashing chamber is separated from the filtration by means of a special sealing.

Lastly, as the main element in this technology it is the SUCTION SCANNER. This scanner is in the central axle of the cylinder filter housing, and it is connected to the backwashing chamber. In this suction scanner, the suction nozzles with nylon brushes are housed. The movement of the scanner allows the nozzles to come into contact with the whole filtering surface.

Filter operation

The water gets in the filter through the prefiltration chamber retaining the coarse particles. Then water goes through the filtering screen outwards, performing the MECHANICAL FILTRATION AT THE SURFACE. High quality filtrated water is obtained according to the screen filtration degrees that range from 10 to 2000 microns.

As it has formerly described, the accumulation of particles generates a differential pressure between both sides of the screen which, once the preset value has been reached, triggers the self-cleaning process. Two analog pressure transducers will trigger the backwashing when a 0,3 bar (3 m.c.a) pressure difference is reached. There are other possibilities to carry out the backwashing: timed backwashings, time and pressure combinations and the continuous backwashing option.

When the pressure transducer indicates 0,3 bar, the drain valve opens what generates a pressure difference between the outside (at atmospheric pressure) and the inside of the filter (working pressure). This speeds water flow that passes through the screen outwards through the nozzles inner hole. Besides this, at this precise moment the motor starts working. The result is the the helical motion of the suction scanner that allows the nozzles to come into contact with the whole filtering surface, thus leaving the cartridge completely clean at the end of the backwashing cycle.

During the backwashing process that lasts 25 seconds, the water is still being filtered and flows towards the application system. This filter design allows an important saving in the amount of water used in cleaning the filter and also assures continuous working.

FMA equipments manufacturing general data

Manufacturing materials:

- Carbon steel housing
- Joints and bolts bichromate quality 5.6 and 5.8
- AISI-316 stainless steel screens
- PVC or stainless steel filtering cartridge.

Surface treatment:

- Surface blasting up to degree SA 2 1/2
- Epoxy-polyester powder coating

Minimum working pressure: 2 bar

Maximum working pressure: 10 bar

Filtration degrees: 80, 125, 200, 500, 1000 microns

Electrical data:

- Operating voltage: Alternating– single-phase (220V 50 Hz)
- Control voltage: 24V DC
- Electrical motor: 1/2 CV (220V/400V)

Manufacturing options:

- AISI 304/ AISI 316 stainless steel housing
- Stainless steel joints and bolts
- SMO 254 stainless steel screens
- Stainless steel 316 / Duplex / Superduplex filtering cartridge

Surface treatment:

- Surface blasting up to degree SA 2 1/2
- Inside anticorrosive coating suitable for sea water and external treatment suitable for sea environment
- Filtration degrees: 10, 20, 25, 50 microns

NOTE: Inside rubber lined coating only for FMA 9000 and FMA 10000 models.

Maximum working pressure: 16 - 25 bar

Electrical data:

- Operating voltage: Alternating – Three-phase (400V 50 Hz) / Continuous – (12 V DC)
- Control voltage: 24V DC / 12 V DC
- Electrical motor: 1/3 CV (12 V DC)
- Optional electrical components with ATEX certificate

*Note: Data show nominal filtration.

Note: Other non-standard specifications on demand.

Electrical data

- Operating voltage
A.C: Single-phase (220V 50hz)
D.C: 12V (optional)
- Control voltage
24V DC / 12V DC (optional)
- Electrical motor
1/2 HP (220V) / 1/3 HP (12V) (optional)

Advantages

- High reliability
- Reduced space
- Nozzles with nylon brushes
- Lower assembly costs
- Easy manufacturing
- Continuous filtration, non-stops for backwashing
- Easy maintenance
- Long durability
- Extensive filtering surface

Electric self-cleaning screen filter FMA 5000

- Automatic screen filter Series 5000 1
- Butterfly valve inlet 2
- By-pass valve 3
- Butterfly valve outlet 4
- Check valve 5

FMA 5000 head loss

Standard technical data

- Manufacturing materials:
 - _ Carbon steel housing
 - _ Joints and bolts bichromate quality 5.6 and 5.8
 - _ AISI-316 stainless steel screens
 - _ Stainless steel cartridge
- Surface treatment:
 - _ Surface blasting up to degree SA 2 1/2
 - _ EPOXI-POLYESTER powder coating

Note: Other non-standard specifications on demand.

Manufacturing materials

- Discs
Polypropylene grooved discs
130 mm external diameter
Polyamide frame and bars made of fibreglass reinforced polyester
- Casing
High resistance polyamide
- Locking system
AISI 316 stainless steel
- Housing
High resistance polyamide
- Seal joints
Nitrile rubber
- Collectors
Carbon steel according to ISO-R/65 II and DIN 2458; blasting up to degree SA 2 ½ and epoxy-polyester coating
- Valves
Brass
Cast iron coated with polyester
- Available microns
100 - 130 - 200 microns

- AISI 304 stainless steel cartridge with a 2 mm coarse screen.
- PVC cartridge with molded plastic tube that supports an AISI 316 stainless steel screen for filtration degrees up to 125 microns
- Polypropylene disc cartridge for filtration degrees up to 130 microns (water flows in opposite direction to the screen).

Note: Other filtration degrees available on demand.

Y pattern filter parts

Y pattern filters 2", 3" and 4" Ø165

IMPORTANT: Pressure taps are supplied with lids. Pressure gauges are optional. The water inlet valve is optional.

Y pattern filters 4" Ø220, 5", 6", 8", 10" and 12"

IMPORTANT: Pressure taps are supplied with lids. Pressure gauges are optional. The water inlet valve is optional

Y pattern filters head loss

Standard technical data

- Manufacturing materials:
 - _ Carbon steel housing
 - _ Joints and bolts bichromate quality 5.6 and 5.8
 - _ PVC cartridge with molded plastic tube that supports an AISI 316 stainless steel screen
 - _ AISI-304 stainless steel cartridge
 - _ Polypropylene disc cartridge
- Surface treatment:
 - _ Surface blasting up to degree SA 2 1/2
 - _ Epoxy-polyester powder coating
- Maximum working pressure: 10 bar (Ask STF-Filtros for other working pressures availability)

Note: Other non-standard specifications on demand.

- Maximum working pressure: 10 bar (Ask STF-Filtros for other working pressures availability)

Note: Other non-standard specifications on demand.

Operation principle

- In metallic filters Y pattern, cyclonic effect, three processes are carried out to improve the filtration efficiency:
 - _ Coarse particles are separated by centrifugal effect.
 - _ Filtration through the stainless steel screen
 - _ Cartridge continuous backwashing, which is produced by the incidence of pressurized water in helical trajectory throughout the filtering cartridge surface.
